WELCOME ABOARD
THE CONCORDE

Leonardo Da Vinci sketched his famous flying machine in 1487, but it would take another 400+ years for the age of powered flight to begin in the early 1900s. Since then, aviation technology has soared to new heights, with each new decade bringing monumental breakthroughs in the field. One of the most significant is the unparalleled Concorde, the world's first commercial supersonic aircraft.

The first Concorde prototype completed a successful test flight from Toulouse, France on 2 March 1969. Just a few months before the first manned moon landing and a mere 60 years after Louis Blériot crossed the English Channel in one of aviation's first major feats. Commercial passenger travel at supersonic speed (up to Mach 2, twice the speed of sound), near the edge of space, was within reach and on track to become accessible worldwide.

Developed before computer technology made 3D design rendering possible, the innovative Concorde design and mechanical features were calculated, tested and refined to perfection by visionary engineers representing the pinnacle of aviation technology and expertise. On 21 January 1976, the first two commercial Concordes took off simultaneously from Paris and London, marking a historic milestone for a strong, collaborative venture piloted by the British and French governments.

On 24 October 2003, the last Concorde flight departed from New York to cross the Atlantic one final time before officially retiring on 26 November of that year. With its 27 years in service, Concorde paved the path to a future in aviation that we can only begin to imagine.

TWO NATIONS ONE VISION

FR
UK

With the advent of technology permitting aircraft to reduce flight times by half, a shared vision of supersonic passenger travel was brought to life through an agreement signed between the French and British governments in the early 1960s. Design, production and assembly were shared between the UK's British Aircraft Corporation and France's Sud Aviation (predecessor of Airbus). Engine design and development were entrusted to SNECMA and Rolls Royce. The Concorde program definitively established European aviation engineering as a cutting-edge industry. Many firsts introduced on the Concorde would find their way onto commercial aircraft such as the A300 and A320 families and become industry standards.

DROOP SNOOT

Lowering the nose and visor allows pilots to see the runway during landing. The maximum droop angle is 12.5 degrees.

WINDOWS

Dry, cool air is circulated between the windowpanes to prevent the extreme heat generated on the outside of the plane from reaching the interior.

PASSENGER CABINS

Passengers are seated in 40 forward cabin seats and 60 rear cabin seats.

WINGS

The uniquely shaped ogival delta wings are essential to creating lift during take-off and limiting drag while in flight.

ENGINES

Reheats allow engines an extra 20% of power for take-off and accelerating to maximum speed.

TAIL LANDING GEAR

Additional landing wheels in the tail accommodate the high angle of attack during take-off and landing.

FROM THE DESIGN TEAM

'The sleek lines and flowing surfaces necessary to slice effortlessly through the sound barrier have ensured Concorde remains in the history books, not only as a remarkable aircraft but also as an undisputed design icon. Those same surfaces, however, posed a real challenge in translating the design into LEGO® bricks! Accommodating such a unique shape alongside mechanisms for landing gear and the iconic droop snoot in the narrow fuselage forced us to really rethink how we build LEGO aircraft. But the Concorde was more than just an aircraft. An extraordinary collaboration between nations, it represented optimism, a vision for the future and it showed us what we can achieve when we choose to work together.'

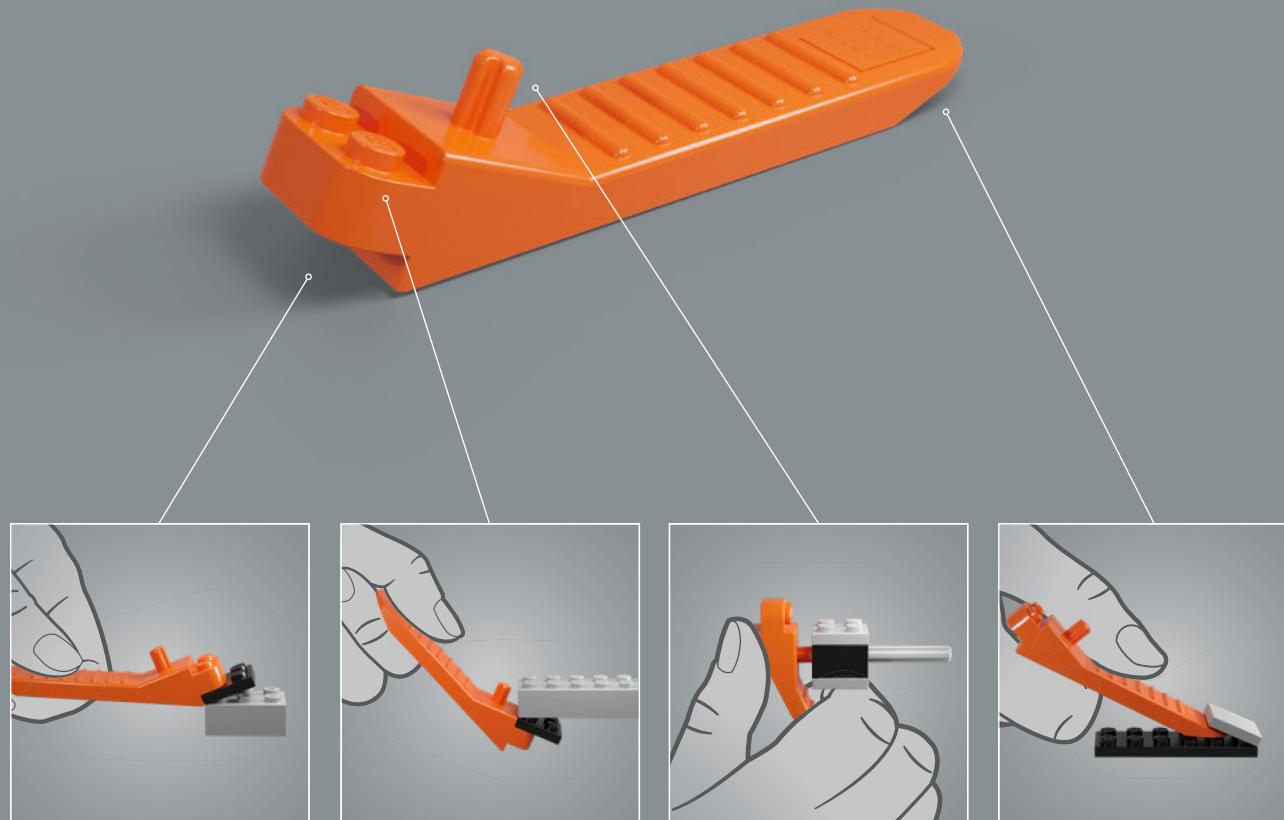

Milan Madge, LEGO® Senior Designer

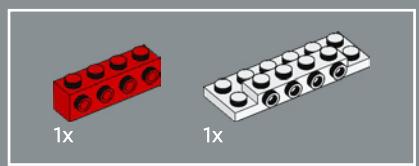

*The name **Concorde** represents harmony
in both design, passenger experience
and collaboration between nations*

The classic Concorde silhouette comes from a very real technical problem, the balance between minimising drag and generating lift on a supersonic wing. The solution: Concorde's ogival delta wing, a modification of the delta wing design to increase efficiency at lower speeds.

Two brand new LEGO® elements were developed exclusively for this model: the nose cone and the visor. Concorde's retractable visor folds down with the nose to reveal the cockpit windscreens hidden behind.

416

2x

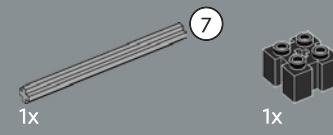

1x

2x

417

418

Concorde's long nose and delta wing were crucial to achieving supersonic speed, but the high angle of attack on take-off and landing and the length of the nose cone made it difficult for pilots to see the runway. The solution – the iconic Droop Snoot!

419

420

The rear trim tank is a fuel tank held in the tail of the aircraft. The centre of gravity of the Concorde had to be different for take-off and supersonic cruising, so the flight engineer transferred fuel between tanks to adjust the aircraft's centre of gravity.

As Concorde required a high angle of attack to optimise the delta wing's lift on take-off and landing, the aircraft featured a small tail bumper wheel to ensure the rear of the plane didn't hit the ground.

The underside of the tail is connected here with a reflected triangle, achieving the sleek tapered form that makes Concorde so iconic.
